FRESHDESK'S BENEFITS

Freshdesk is a special cloud-based customer relationship management (CRM) tool, which is designed to facilitate and improve customer support. Using an advanced ticketing system, Freshdesk allows a user to manage, prioritize and resolve tickets efficiently, allowing team members to move quickly, focus on the right issues and deliver a more personalized support to their customers or suppliers.

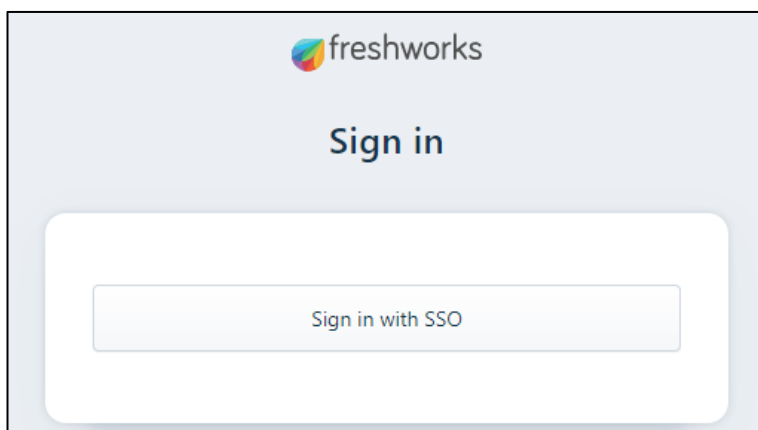

There are several benefits with having Freshdesk as a CRM tool, including:

- A streamlined workflow, allowing actions, emails and notes related to a particular request accessible in a singular ticket.
- Allowing an automated or manual distribution of tasks/tickets among team members, which can be personalized per need, ensuring optimal workload for everyone.
- Helps you or your leaders track and assess each team member's workload more efficiently, saving a lot of time and reducing repetitive work.
- Having a built-in and customizable knowledge base, which your leaders can customize based on your team's needs, allowing users to easily find answers to their questions.
- Has a built-in analytics feature, which can be customized to best facilitate your team's decision-making activities.

ACTIVATING & LOGGING IN TO FRESHDESK

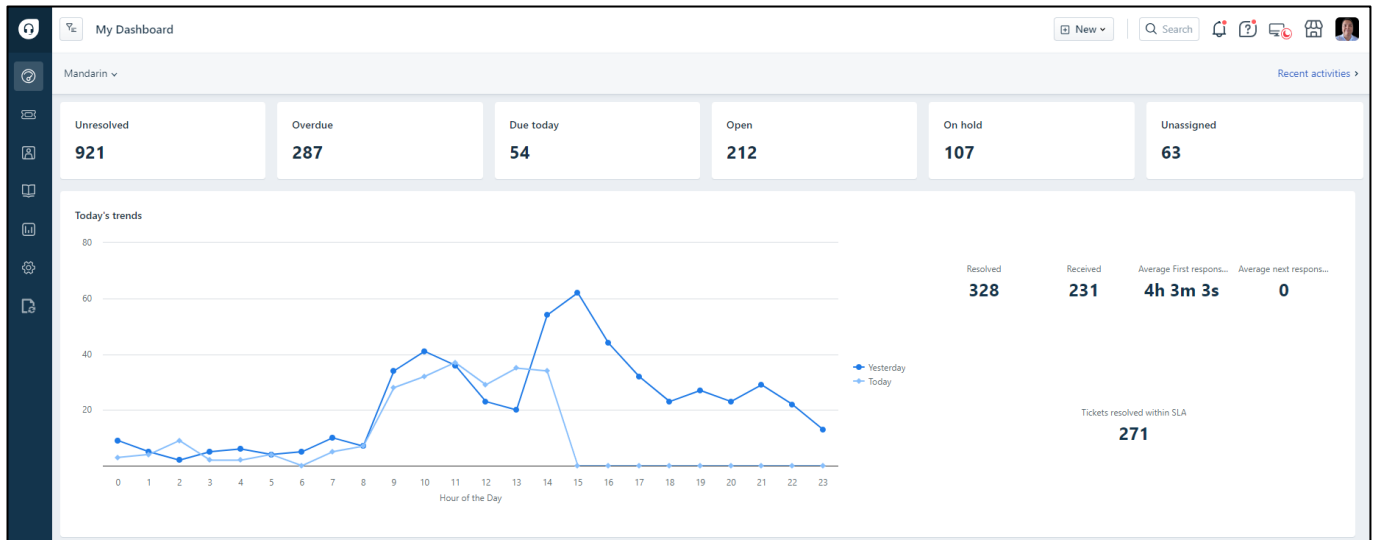

Once a user's Freshdesk account has been created, an activation email will be sent from Freshworks to the user's email address. The user needs to click the link/button to activate Freshdesk, which would lead to a new tab to open, asking the user to sign-in.

On the user's first instance and every instance after of signing in, the user does not need to input a username and password. Instead, the user will be requested to sign in via the WebBeds SSO (Single Sign On) method, allowing the team member to securely login to multiple applications with one set of credentials.

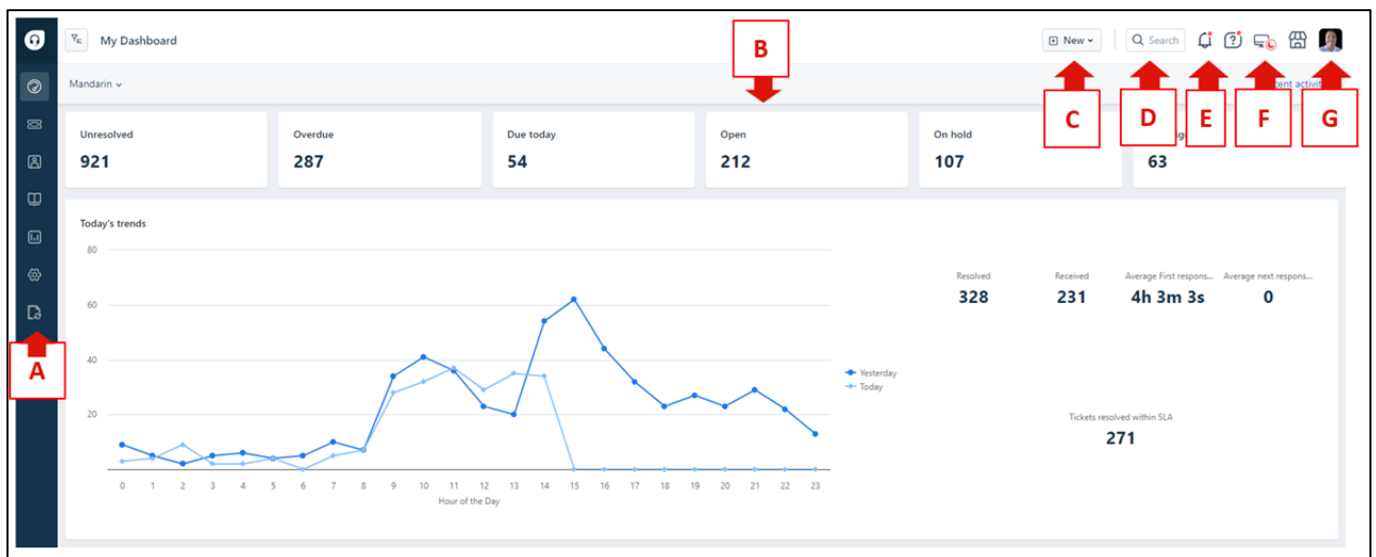

FRESHDESK'S HOMEPAGE

Once a team member is logged in to Freshdesk via SSO, the first screen a user will see will be the Freshdesk homepage. The homepage shows majority of the functionalities that will be used by a Freshdesk user in handling their tickets/tasks.

The Freshdesk Homepage gives a user access to:

- A. **Freshdesk Section Icons:** clicking on these icons will bring a user to the specific Freshdesk section chosen, allowing a different functionality to load in the Main Working page.
- B. **Main Working Page:** the middle part of the homepage, where most of the actions and functionalities for the tickets are done. The functionality in this area changes depending on which section chosen by the user.
- C. **New Email or New Ticket box:** allows a user to create a new email or create a new ticket.
- D. **Search box:** allows a user to search for tickets, contacts, solutions and other information within Freshdesk.

- E. **Notifications:** gives a user access to notifications regarding tickets that a user has handled.
- F. **Freshdesk Status:** allows a user to change their status in Freshdesk, which can allow the system to automatically assign tickets to a user from groups that a user is assigned in.
- G. **User Menu:** allows a user to access their Freshdesk profile, change the time zone and input their signature for their Freshdesk emails.

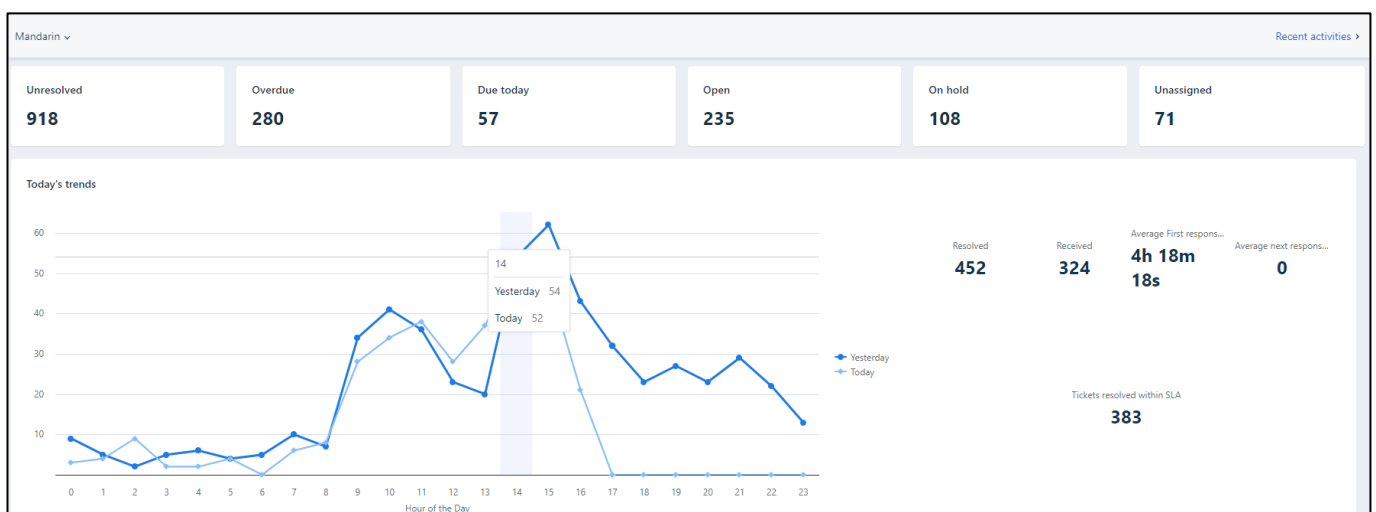

FRESHDESK SECTIONS

The left side of the Freshdesk homepage gives a user access to a column with icons that allows you to access different section of Freshdesk. Clicking on each of the section icons will load the chosen functionality in the middle part of the page.

	Back to the Homepage	
	Dashboard section	Shows a summary of your/your group's productivity and performance
	Tickets section	Allows a user to view or actions tickets assigned to you or your group
	Contacts/Companies section	Allows a user to view email addresses of our contacts (ex: Customers/Suppliers) on file
	Solutions section	The internal knowledge base in Freshdesk, allowing the access to functionalities and processes uploaded for your team
	Analytics section	Allows your Leadership team to view, run and download reports and analytics, based on the tickets handled in Freshdesk
	Admin section	Allows certain users to adjust certain functionalities and access roles in Freshdesk

THE DASHBOARD SECTION

The Freshdesk Dashboard is the section in Freshdesk that allows a user to view performance and productivity summaries, as well as access a set of filtered tickets, dependent on what option was chosen by the user.

The Freshdesk Dashboard has three main parts/sections, which a user can access or give information:

- A. **Dashboard Group Filters:** these filters, only available for users with Supervisor access or above, allows a user to filter the Dashboard's information/data to a specific Freshdesk group.

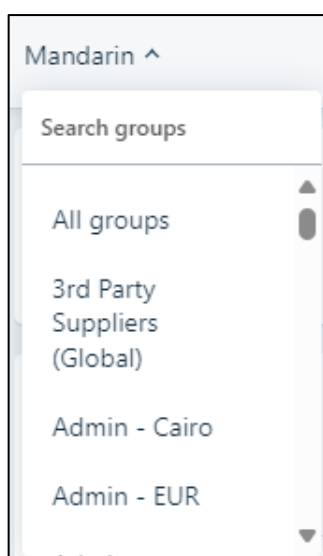

For users with agent access, these group filters are not available for them to choose.

- B. **Productivity Counts:** these give a user access to view current productivity numbers and view a set of filtered tickets, based on the option chosen.

A user with agent access can only view productivity numbers/tickets under their name. However, a user with Supervisor access or above can view productivity numbers/tickets for a specific group chosen.

- C. **Ticket Resolution, Volume, SLA and Trends:** these give a user a summary of data regarding ticket resolution, ticket volume, SLA and ticket trends.

DASHBOARD GROUP FILTERS

Users with supervisor access (or above) will have access to the Freshdesk dashboard's group filters. These filters will allow a user to choose a specific group that they would like to view information about. Only Freshdesk Admins can create/add Freshdesk groups.

Once a group is chosen, the information/data and trends in the dashboard will filter to those of the chosen group. Example, if a leader chose the Mandarin group, the productivity counts, resolution/volume data and trends will be based on information for the Mandarin group.

To choose a dashboard group filter, the user needs to click on the Dashboard Group filter link in the top left corner of the dashboard. This will open a pop-up box with all the available Freshdesk groups to be chosen.

PRODUCTIVITY COUNTS

The productivity counts in Freshdesk allows a user to view the current productivity numbers and/or view a set of filter tickets, based on the productivity count chosen. The available productivity counts, and its data, depends on the Freshdesk access a user has.

If a user has **supervisory access (or higher)**, the team member can view data/tickets for a specific group chosen, from the dashboard group filters. The unassigned productivity count is also available for the user.

Mandarin ▾ Recent activities >					
Unresolved 919	Overdue 286	Due today 62	Open 234	On hold 107	Unassigned 61

If a user has an **agent access**, the team member can only view data/tickets for him/herself.

Unresolved 72	Overdue 10	Due today 0	Open 3	On hold 2
-------------------------	----------------------	-----------------------	------------------	---------------------

There are six different productivity counts that a user may encounter in Freshdesk:

Unresolved 994

UNRESOLVED

This productivity count shows the number & allows a user to view all the unresolved tickets under the user's name (if with agent access) or a group's name (if with supervisory access).

Overdue 330

OVERDUE

This productivity count shows the number & allows a user to view all the tickets that are above the SLA (Service Level Agreement).

Due today 41

DUE TODAY

This productivity count shows the number & allows a user to view all the tickets which will be above the SLA (Service Level Agreement) today and may need to be prioritized. Otherwise, if they go above the SLA, they become overdue.

Open 246

OPEN

This productivity count shows the number & allows a user to view the tickets which are assigned to the user (if with agent access) or the group (if with supervisory access), are newly received and have not been actioned yet.

On hold 88

ON HOLD

This productivity count shows the number & allows a user to view the tickets which are placed a Pending Customer Response status and would need to be followed up.

Unassigned

11

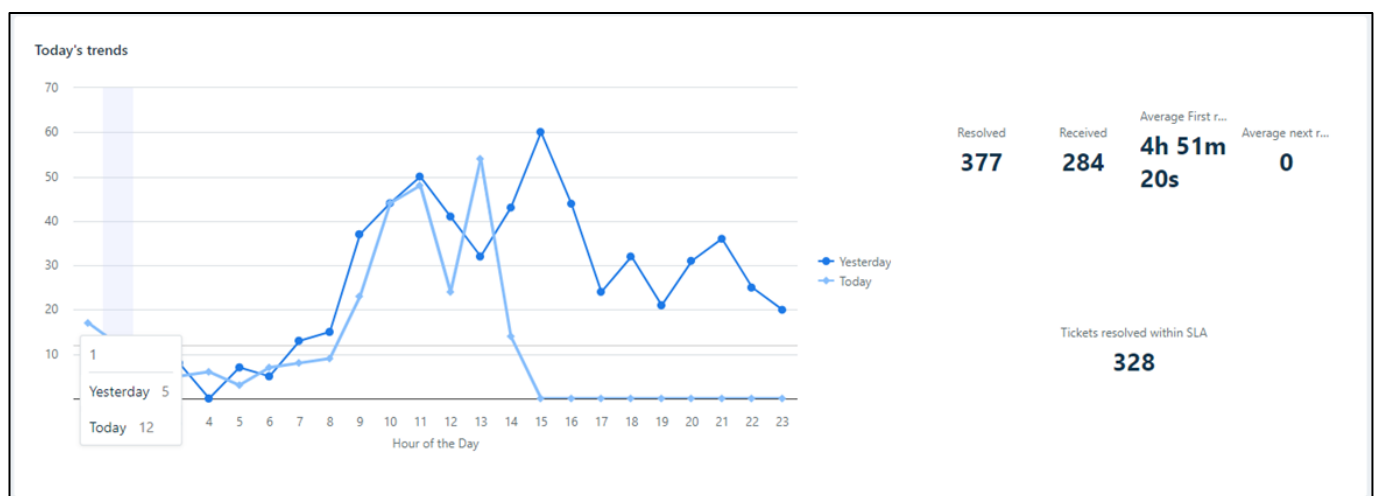

UNASSIGNED

This productivity count shows the number & allows a user to view the tickets which are newly received in a FD group and have not been assigned to a user. This is only available for user with a supervisory access or above.

TICKET RESOLUTION, VOLUME, SLA & TRENDS

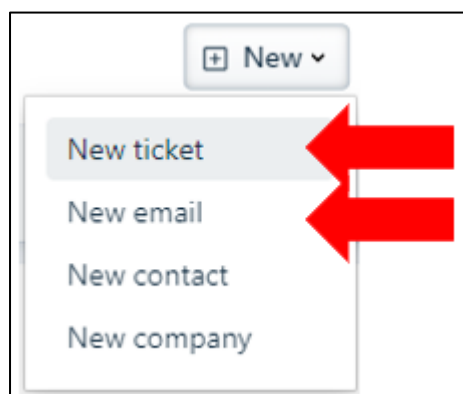

The middle part of the dashboard will show data, graphs and summaries regarding the current day's:

- # of resolved tickets for the specific group.
- # of received tickets for the specific group.
- Average first response time for the group.
- # of tickets received that are within the SLA.
- A graph showing the trend of tickets received today, based on yesterday.

NEW EMAIL/TICKET

On the top left part of the homepage is the NEW icon. Clicking on this icon will load a pop-up box that will give a user to the following functionalities:

NEW TICKET: allows a user to create a ticket from scratch, without the need of writing an email. This is best used when a ticket needs to be created from a fresh phone call or an instruction from the Teams chat.

NEW EMAIL: allows a user to create a new outbound email, to be sent to a specific recipient. Once this email is sent, a new ticket trail is created with a separate ticket number.

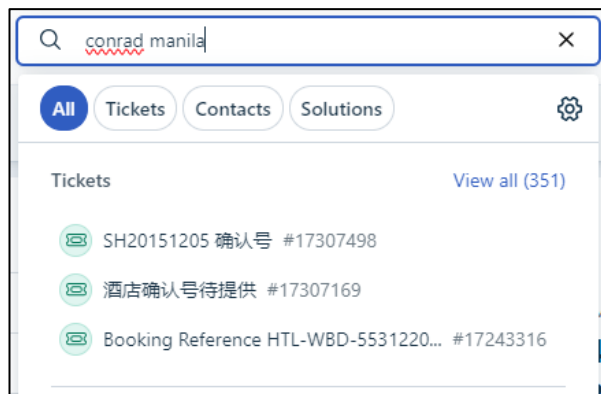

NEW CONTACT/NEW COMPANY: allows a user to add a new contact's/company's information in Freshdesk. However, as the contact information is immediately created once an email is received, this is rarely used by team members.

SEARCH BOX

Beside the NEW icon is the SEARCH BOX, which gives a user access to Freshdesk's internal search engine. The search box works as powerful as Google, which allows a user to search for anything in Freshdesk, whether they are tickets, knowledge base solutions or contacts, among others.

If the search box is not used, the box itself will be collapsed.

However, clicking on the search box expands it, allowing a user to search for longer search terms, keywords or booking numbers, depending on a user's need.

It is also possible to search for keywords in other languages' characters (ex: Hanyu Pinyin for Chinese Phonetic Alphabet), provided there are tickets in Freshdesk using these characters.

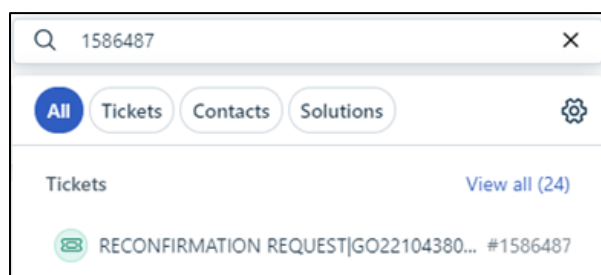

Once you've input the search term, a drop-down box will expand with the results available.

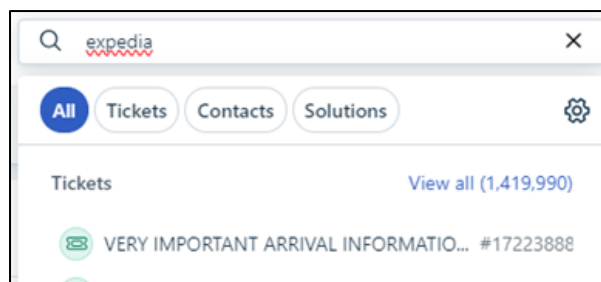

The results in the pop-up box would only show 3 results. If there are more than 3 results for the term that was searched, the user will see the **View All** link in the top right part of the results.

The user can either click on the View All link to open it on the current tab of the browser; or open the results in a new tab, whichever is preferred.

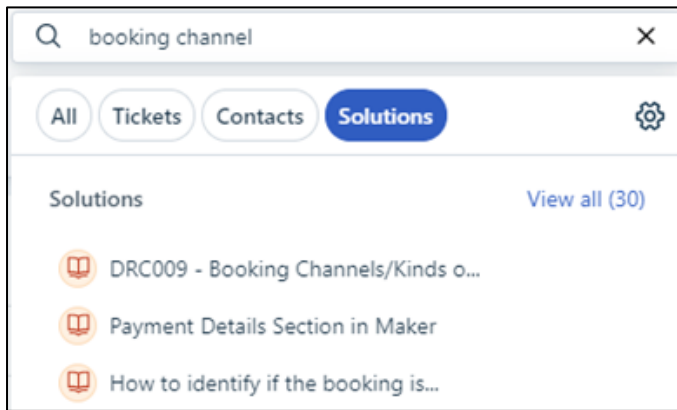

There are four most common things that are searched for in the Freshdesk search box:

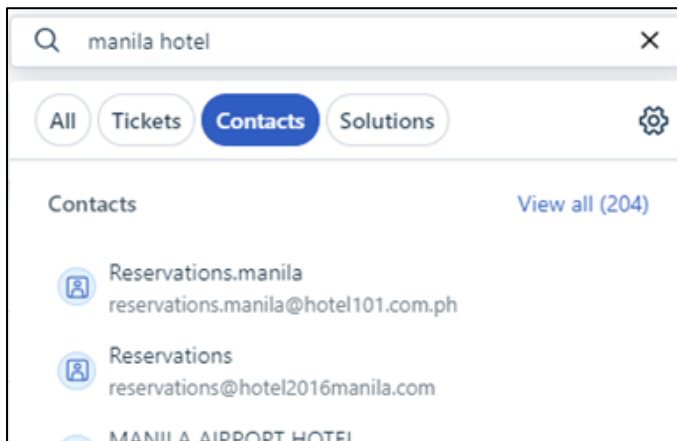

Searching for tickets via **Booking Reference #s** or **Ticket Numbers**

Searching for tickets via a **Hotel Name** or **Supplier Name**

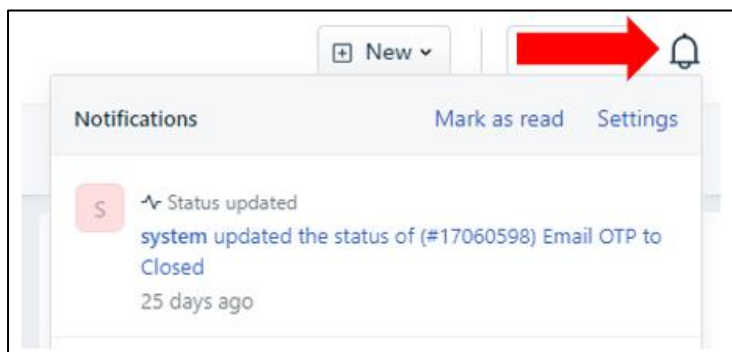

Searching for Knowledge Base/Solution Articles, based on keywords

Searching for Contact Details of Customers or Suppliers/Hotels

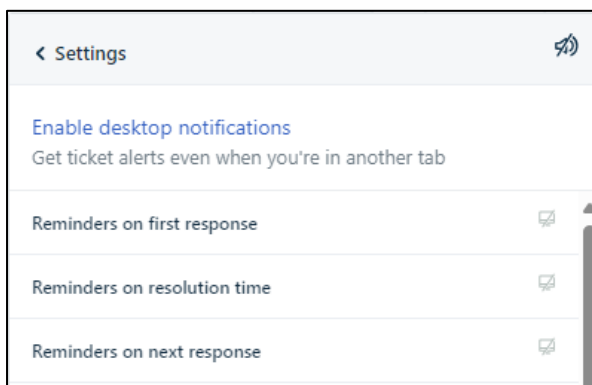

NOTIFICATIONS

The notifications section can be seen in the top right part of the homepage, beside the Search box.

Clicking on the bell icon will load a pop-up box with the list of notifications a user has received for the different tickets he/she has handled.

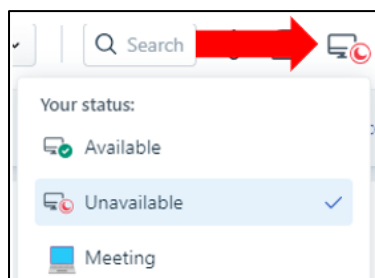

Clicking on a notification will open the related ticket to the notification, for easy access. A user also has the option to mark all the notification read.

Clicking on the Notification Settings will allow a user to customize the notifications they would like to receive in Freshdesk – allowing the user to choose which actions in Freshdesk they would like to receive a reminder or notification on.

A user can also turn on or turn off (mute) the notifications, based on their preference.

FRESHDESK STATUS

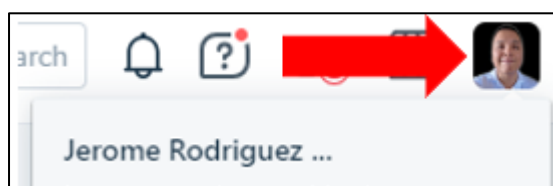

Freshdesk allows both manual and automatic assignment of tickets to user, based on their group's need. If a team member is part of a group which automatically assigns tickets, the user will need to adjust their Freshdesk status to allow the automatic assignment to work.

The user will need to click on the Freshdesk Status icon, located beside the search box and notification icons, to choose his/her Freshdesk status.

Choosing Available as a status will turn on the automatic assignment of tickets. Unavailable, on the other hand, turns the automatic assignment off. A user also has the functionality to schedule their Out of Office hours, if preferred.

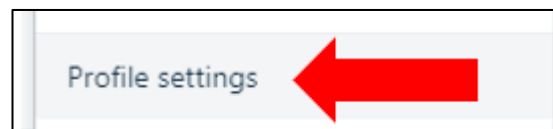

USER MENU

The right most icon in Freshdesk allows a user to access the User Menu section. This section allows a user to open and adjust certain things in their Freshdesk profile as well as log out from Freshdesk. The user can also log-off from Freshdesk via the User Menu.

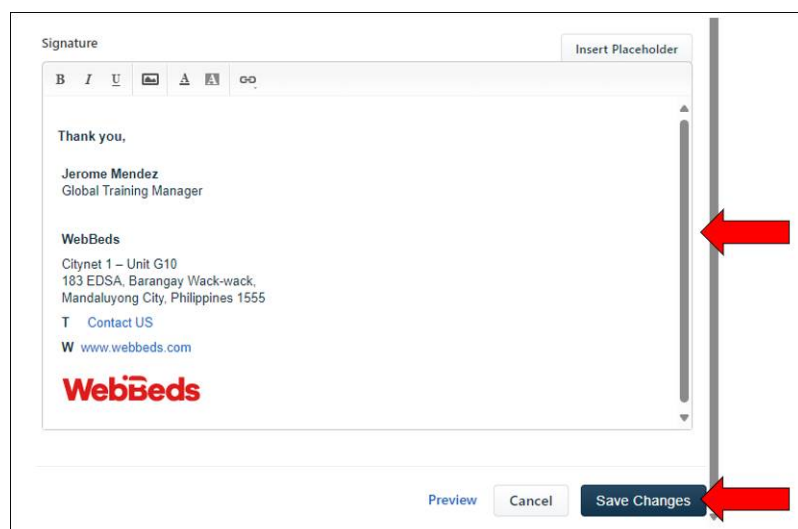

The User Menu icon will show the profile picture of a user, if a picture has been uploaded. Otherwise, the initials of a user will be what will show instead.

USER PROFILE AND FRESHDESK SIGNATURE

Clicking on the User Menu icon, followed by the Profile settings link, will allow a user to open the Freshdesk User's profile. The user profile allows a user to:

- Upload a profile picture
- Adjust the time zone that applies for the tickets
- Adjust the language used in Freshdesk
- Upload and input the user's signature for his/her emails

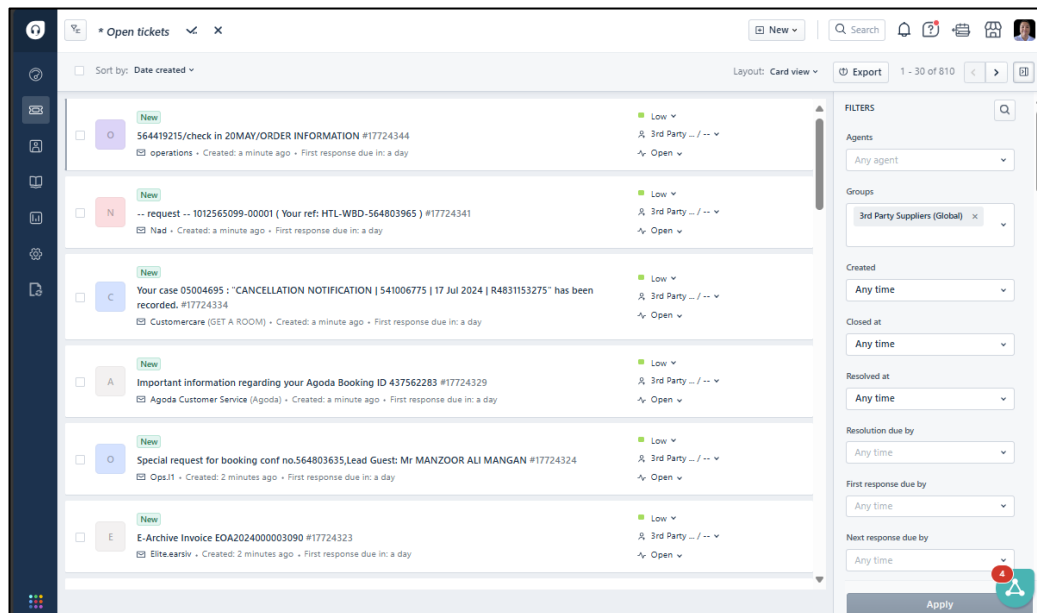

A user can input their WebBeds approved signature in the Signature box, located in the lowest part of the User Profile page. The signature can include a mix of text, links and images.

Once the signature is input, the user will need to click on the Save Change button to allow the signature to be saved for all emails that the team member will send out, moving forward.

THE TICKETS SECTION

The Tickets Section in Freshdesk is where majority of the functionalities are handled by a user. This section allows a user to view ticket assigned to him/herself or a group, filter and view a set of tickets based on the need and action an existing ticket, among other things.

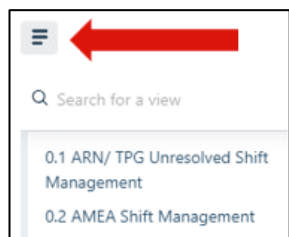

DIFFERENT WAYS OF VIEWING TICKETS

There are four common ways that a user can view their tickets, whether it's for an individual user (with agent access) or for a group a leader is managing (with supervisory access). These include viewing tickets via:

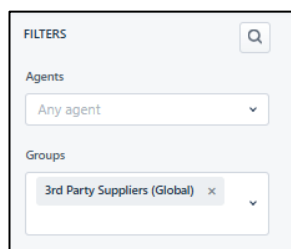

THE PRODUCTIVITY COUNTS IN THE DASHBOARD

Once a user clicks any of the productivity counts in the dashboard, Freshdesk will load the tickets section and filters the tickets, based on the productivity count chosen. This is a set filter, which cannot be adjusted.

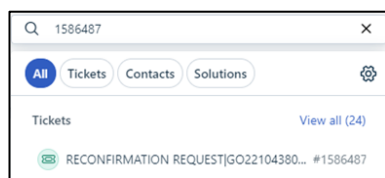

THE TICKET VIEW IN THE TOP LEFT PART OF THE TICKET SECTION

On the top left part of the ticket section is a trigram, or three dots icon. Clicking on this will open a pop-up with pre-set ticket views, which would allow a user to view a set of filtered tickets.

THE TICKET FILTERS IN THE RIGHT SIDE OF THE TICKET SECTION

The right side of the ticket section will load a set of filters, which a user can use to filter the type of tickets he/she would like to view. These can be viewed for a one-time use or can be saved for future use.

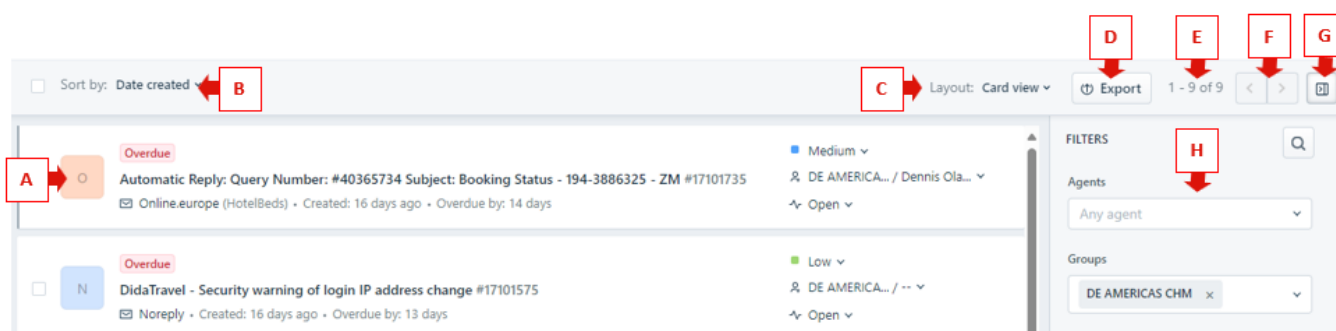

THE SEARCH RESULTS OF THE SEARCH BOX

Once the search results load, a user has an option to click on the specific result to load the ticket on the same window. The user also has the option to open the ticket in another tab or window.

PARTS OF THE TICKET SUMMARY PAGE

Once the filters have been loaded, the resulting list of tickets will appear in the Ticket Summary page of the ticket section. On this page, there are several functionalities that a user can use to help him/her manage and handle the assigned tickets under their name/group's name.

- A. **THE TICKET SUMMARY:** This will load a short summary for that specific ticket, including its subject, status, user, and priority, among others.
- B. **SORT BY:** This allows a user to sort the ticket results chronologically via several sort options, including Date Created, Due By Time, Last Modified, Status, among others.
- C. **LAYOUT:** This allows a user to adjust how they would like to view the layout of a ticket: either via Card View or Table View.
- D. **EXPORT:** This allows users with supervisory access to download the tickets, together with specific ticket fields chosen, in an Excel format, whether via a CSV or XLS (Excel) format.
- E. **TICKET COUNT PER PAGE:** This shows a user the # of tickets in a specific page, over the total number of tickets, based on the filters a user has input. This differs, depending on the filters chosen. There is a maximum of 30 tickets in a specific page.
- F. **CHANGE PAGE BUTTON:** This allows a user to move to either the next page or back to a previous page of tickets.
- G. **EXPAND/COLLAPSE BUTTON:** This allows a user to either expand or collapse the filters section, allowing the user more space to view the ticket summary.
- H. **TICKET FILTERS:** This allows a user to filter the tickets he/she would like to view, based on certain specifications/filters available.

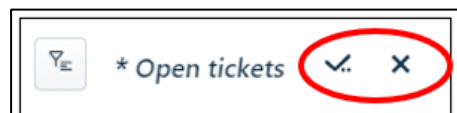

TICKET FILTERS

The ticket filters, located at the right side of the ticket summary, allows a user to filter the tickets they would like to view, based on the different available specifications.

A user can use several filters for the available list, based on his/her needs, to limit the list of tickets that the user would like to view. Once the user has chosen the ticket filters that he/she wants to use, the user would need to click on the Apply button, located in the lowest part of the filters, to load the ticket results.

CREATING A TICKET VIEW

Once a user has filtered the list of tickets that he/she wants to view, it would be possible for the user to save these set of filters in a ticket view. A ticket view allows the user to view a list of tickets, based on a set of filters chosen in the ticket fields, without the need of manually filtering again.

If a user would like to save the filters in a ticket view, the user will see two additional icons on the top left part of the ticket summary page: the Check Mark and the X Mark.

Check Mark → clicking on this allows a user to save the filter in a ticket view.

X Mark → clicking on this allows a user to discard the filters and changes made in the ticket summary page. The ticket section will then revert to its default view.

SAVING A TICKET VIEW

A user has the option to input a name and save the set of filters chosen in the ticket summary into a ticket view. However, access to the ticket view differs on the access that a user has in Freshdesk.

If a user has an agent access only in Freshdesk, the user can save the set of filters in a ticket view, which will only be viewed by the user alone. This cannot be viewed by any other Freshdesk user or group.

If a user has a supervisory access (or above) in Freshdesk, the user can save the set of filters in a ticket view and the user will be given an option of which set of users can view the ticket view:

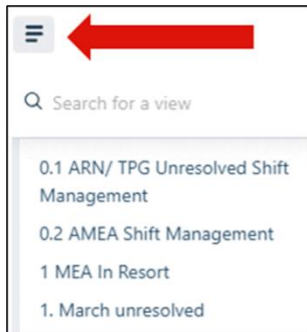

Just me: if this is chosen, the ticket view can only be viewed by the specific user who saved the view.

All Agents: if this is chosen, the ticket view can be viewed by all agents using Freshdesk.

Agents in groups: if this is chosen, an FD group can be chosen, which would allow only users in that specific FD group to view and use the said ticket view.

Once the name of the ticket view has been input and the access to view it has been chosen, the user will need to click on the Save button to save the ticket view for future use.

VIEWING THE EXISTING TICKET VIEWS

If a user would like to access and view any of the existing ticket views in the ticket summary page, the user can access the list by clicking on the **trigram (three dots icon)** located in the top left part of the ticket summary page.

Clicking on this will expand a pop-up box with the list of all the ticket views available for a user, which includes:

- Any of the default ticket views created.
- Any of the ticket views created by the user.
- Any of the ticket views created by the user's leaders.

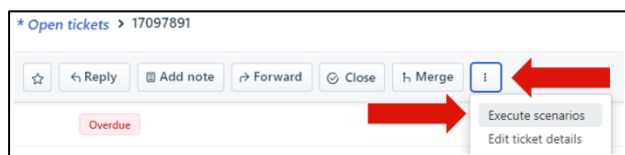

ASSIGNING TICKETS

ASSIGNING TICKETS TO ANOTHER FD GROUP (WITHOUT A USER)

Normally, a ticket is automatically assigned to a specific Freshdesk group, depending on the said logic set for the ticket distribution. For example, it can be set wherein emails sent to a specific email address or from a particular contact (ex: Customer Name) will go to a specific set Freshdesk group automatically.

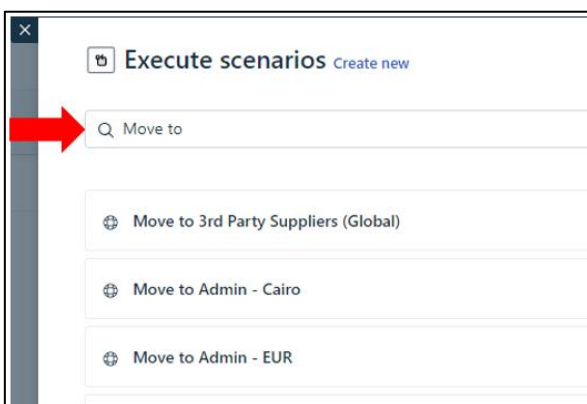

However, there are instances wherein an email is sent to a wrong email address, or a ticket is distributed to the wrong Freshdesk group, leading to a user who does not handle the ticket to access this. When this situation happens, the ticket needs to be forwarded to another/the correct Freshdesk group handling the ticket.

It is possible for a user to transfer the ticket easily to another Freshdesk group, without the need of adjusting any of the ticket properties. To do this, the user will first need to open the ticket itself and ensure that the ticket is not part of the Freshdesk group the user is part of.

Once a user confirms that the ticket is a mis-routed ticket and not handled by the Freshdesk group he/she is part of, the user needs to click on the **ellipsis (three dots icon)** in the top left part of the ticket.

A drop-down list will then appear below the ellipsis. From the choices in the drop-down list, the user will need to choose and click the option for **"Execute Scenarios."**

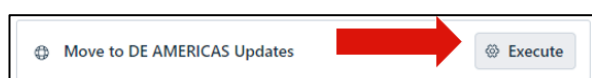

A pop-up box will appear on the right side of the ticket, which would show the full Execute Scenarios functionality.

There would be a search box in the top-part of the box, where a user would need to type in the words: **"Move to..."** Doing this will limit the scenarios that a user can view to the specific scenarios regarding transferring a ticket to another Freshdesk group.

The user will need to search for and choose the correct Freshdesk folder scenario to transfer the ticket to.

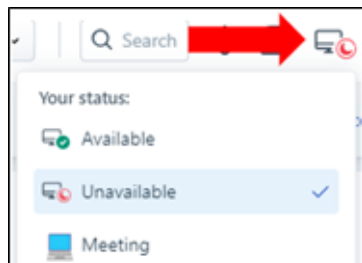

Once the correct Freshdesk folder is chosen, the user needs to hover his/her mouse and click on the Execute button on the right side of the option. This will transfer the ticket to the correct Freshdesk group without the need of any ticket property change.

ASSIGNING TICKETS TO A SPECIFIC USER

In Freshdesk, there are two ways for ticket to be assigned to user: Automatic Assignment or Manual Assignment of tickets.

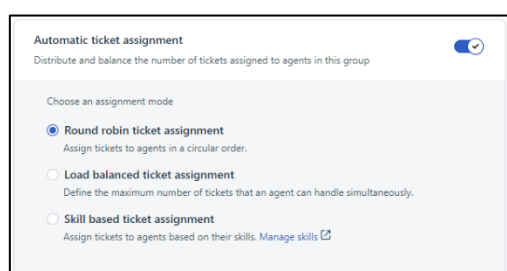

AUTOMATIC ASSIGNMENT OF TICKETS

If a team member is part of a group which automatically assigns tickets, the user needs to adjust their Freshdesk status to allow the automatic assignment to work.

The user will need to click on the Freshdesk Status icon, located beside the search box and notification icons, to choose his/her Freshdesk status.

Choosing Available as a status will turn on the automatic assignment of tickets. Unavailable, on the other hand, turns the automatic assignment off.

The distribution of the automatic ticket assignments differs, depending on how the group was set up by the Freshdesk admins for your teams.

By default, tickets are automatically assigned in a Round Robin system, which allows tickets to equally be distributed to the available agents in a circular order.

However, there is an option for the Freshdesk Admins to set up the automatic ticket assignment in either a Load Balanced system – which allows an Admin to define the maximum number of tickets an agent will be automatically assigned to handle simultaneously – or a Skill Based system – where tickets will be assigned to agents automatically, based on specific defined skill sets.

MANUAL ASSIGNMENT OF MULTIPLE TICKETS

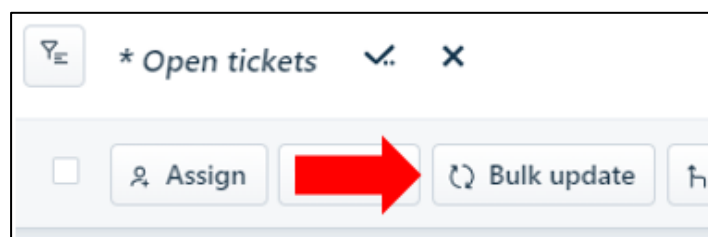

If a team member is part of a group which manually assigns tickets, the tickets are manually distributed either by a group/team's supervisor or POC in bulk or multiple tickets in one go. This can also easily be done in Freshdesk, as well.

To allow a leader to assign multiple tickets to a specific user, this can easily be done in Freshdesk via the Bulk Update functionality in the ticket summary page.

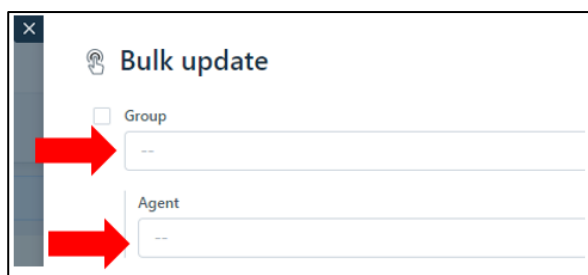

Firstly, the leader would need to choose and click the tick boxes of all the tickets that he/she would like to assign to a specific user or individual.

The leader can assign a maximum of 30 tickets in one go to a specific user.

Once all the tickets needed to be transferred have been chosen, the leader would need to click on the Bulk Update button, located at the top part of the ticket summary page.

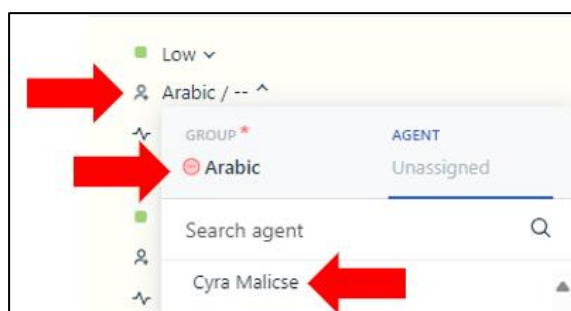

A pop-up box will appear on the left side of the ticket summary page – for the Bulk Update options.

The leader will need to scroll down until he/she sees the option to adjust the Group and Agent names. Once found, the leader will need to choose the Freshdesk group and the username that the tickets will be assigned to.

Once done, the user will need to click on the Update button in the lower right part of the page. This will complete the re-assignment of the multiple tickets to the specific chosen user. The leader can then proceed to assign another set of tickets to another user.

MANUAL ASSIGNMENT OF INDIVIDUAL TICKETS

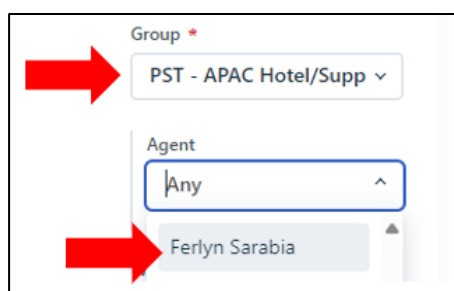

If an individual ticket will need to be transferred to a specific user, there are two ways that this can be done in Freshdesk: whether via the Ticket Card or via the Ticket Properties.

ASSIGNING VIA THE TICKET CARD

The right side of the ticket card allows a user to view and assign the group and user the ticket would be assigned to.

The user will need to click on the Ticket Owner option, which opens a pop-up box that allows the user to set the Freshdesk group and agent name that the ticket will be assigned to.

ASSIGNING VIA THE TICKET PROPERTIES

If a user has the ticket open, he/she can also assign a ticket to a respective group and user via the Ticket Properties section.

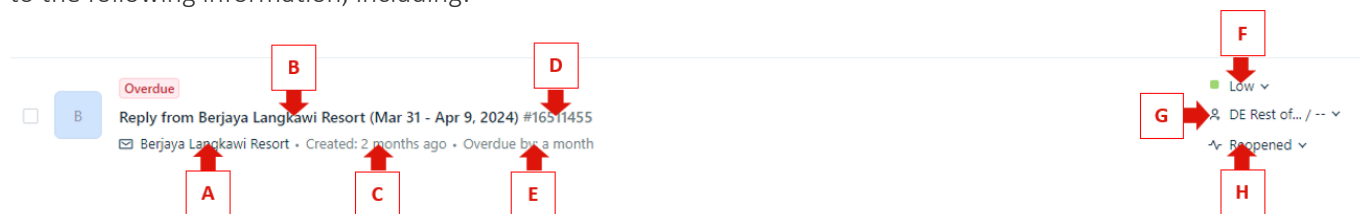

The user will need to scroll down until the Group and Get section is seen. From there, the user will need to choose the FD group and Agent name to which the ticket will be assigned to. Once this is done, the Update button needs to be clicked to allow the ticket to be re-assigned.

Take note, however, that assigning a ticket via the Ticket Properties requires all the necessary, mandatory ticket properties in Freshdesk to be filled out first, before the ticket is re-assigned to another group or user via the ticket properties.

PARTS OF A FRESHDESK TICKET

THE TICKET SUMMARY

The individual ticket cards in the ticket summary page gives a user a short summary of the ticket. It gives a user access to the following information, including:

- A. **CONTACT NAME:** This shows the name of the contact (which can be the Customer, Supplier or a WebBeds user) who send the initial email that created the ticket.
- B. **TICKET SUBJECT:** The ticket subject would be the same with the subject line of the first email of the ticket trail.
- C. **LAST MODIFIED DAY:** This shows the user, depending on when and the action done on the ticket, either a. when the ticket was created or when the ticket was last actioned or modified.
- D. **TICKET NUMBER:** This shows the user the individual ticket number assigned to the ticket.
- E. **TICKET DUE DATE:** If the ticket is not yet above SLA, this section will show when the ticket will be past the SLA. However, if the ticket is overdue, this section will show since when is the ticket overdue.
- F. **TICKET PRIORITY LEVEL:** This shows the user if a ticket is Low, Medium, High or Urgent Priority. This can be automatically set, based on specific logic set by the Freshdesk admins, or manually set for the ticket by a user.
- G. **TICKET OWNER:** This shows the user which group and/or user is assigned to handle the ticket. Clicking on this section also allows a ticket to be assigned to a different group or user.
- H. **TICKET STATUS:** This shows the user the status of the ticket, helping the user know if the ticket has been actioned, needs action/follow up or has been resolved.

ADDITIONAL TICKET STATUSES IN THE TICKET SUMMARY

On certain situations/specifications, there are additional, supplemental ticket statuses that a user will see in the top-left part of the ticket card. These statuses give additional insight about the respective tickets, to help a user know what the necessary next steps are.

NEW: This status appears if the ticket is newly received, and no action has been taken on the ticket yet.

FIRST RESPONSE DUE: This status appears if no user has actioned/responded to the ticket after some days and the SLA/ticket deadline is nearing.

OVERDUE: This status appears if the ticket is already above the set SLA to either respond/action the ticket or to resolve the ticket.

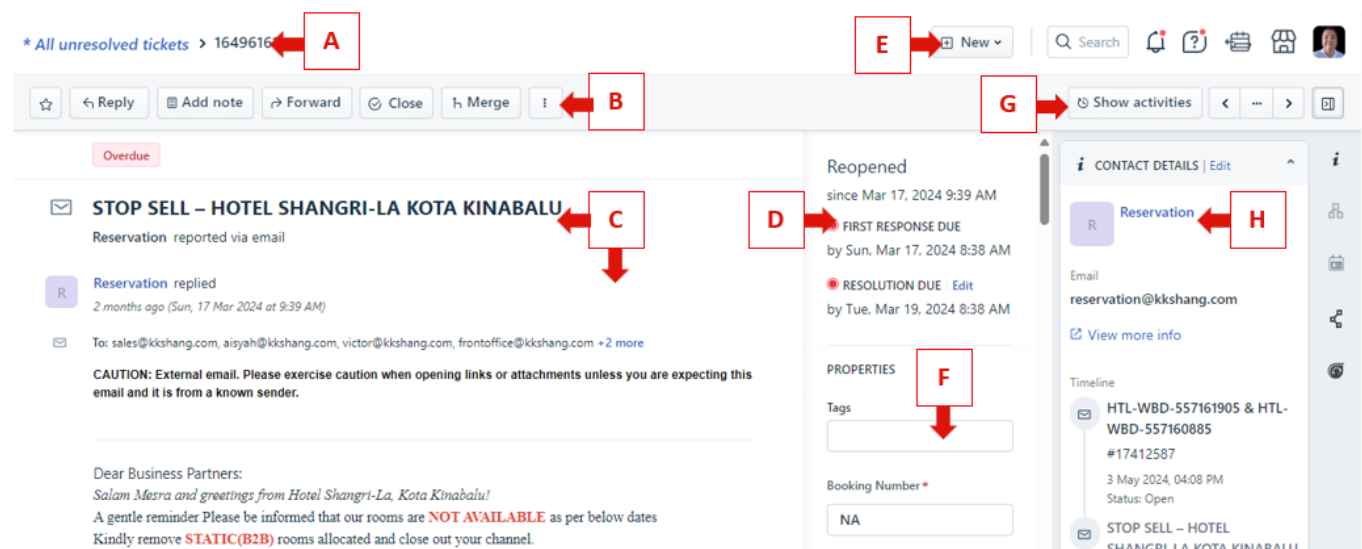

CUSTOMER RESPONDED: This status appears if someone responded to the ticket – whether it was the customer/supplier or an internal WebBeds team member.

THE FRESHDESK TICKET

PARTS OF A FRESHDESK TICKET

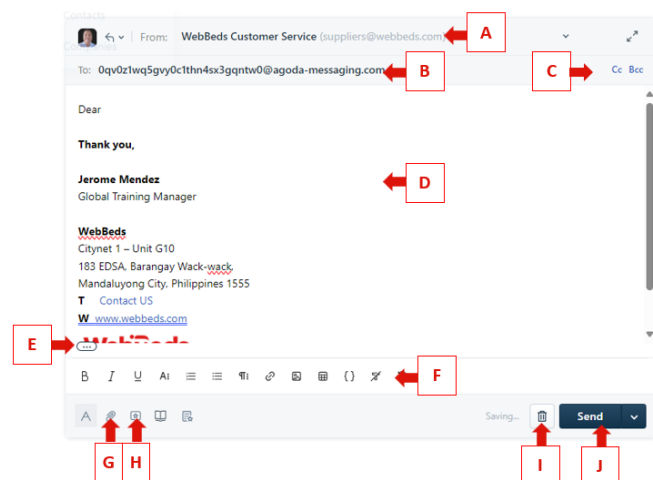

Once a user clicks on a specific ticket card, it will open the Freshdesk ticket in full. This is where majority of a user's action within a ticket is handled/done. A user will have access to the following:

- A. **TICKET NUMBER:** This shows the user the individual ticket number assigned to the ticket.
- B. **TICKET ACTION BUTTONS:** This section of the ticket gives a user to the different functionalities available to action, respond or input a note in the ticket. This section allows a user to reply or forward an email, add an internal note, adjust the ticket details, among other things.
- C. **TICKET SUBJECT AND TRAIL:** This section is where all inbound and outbound emails, together with internal notes, connected to the ticket is shown and chronologically arranged for the user – from the most recent to the oldest action/communication.
- D. **SLA GUIDE:** This section gives a user a guide on the SLA for the ticket, specifically on when a response is due and when the resolution deadline is.
- E. **NEW BUTTON:** This button gives a user access to create a new ticket or a new email, depending on the need.
- F. **TICKET PROPERTIES:** This section of the ticket allows a user to input the necessary supplemental information of the ticket. The information that needs to be filled out in this section differs, depending on what WebBeds department you are part of (whether Customer Service or Data Entry).
- G. **SHOW ACTIVITIES SECTION:** This section gives a user access to view a summary of all the actions/modifications done on and users who handled the ticket.
- H. **CONTACT DETAILS:** This section gives a user access to the contact's information as well as other tickets that the contact has sent out.

THE FRESHDESK EMAIL MESSAGE BOX

The Freshdesk Email message box has several parts that a user can input to/adjust or update, allowing the user to action and correspond to the ticket, including:

- A. FROM EMAIL field
- B. TO EMAIL field
- C. CC and BCC fields
- D. MAIN EMAIL BODY & SIGNATURE
- E. ELLIPSIS (Three Dots Icon)
- F. FORMATTING OPTIONS
- G. ATTACHMENT
- H. CANNED RESPONSES
- I. DISCARD EMAIL
- J. SEND/FORWARD BUTTON (depending on the function chosen)

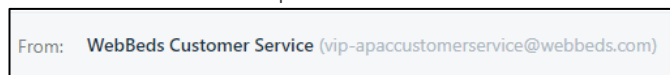

FROM EMAIL

The FROM EMAIL field shows the email address where the email will come from. Subsequently, this is the email address which will receive any emails received from our contacts, whenever they reply to our correspondence. The FROM EMAIL address that a team member will see depends on whether they are sending a new email or sending a reply/forwarded email.

If a team member is sending a new outbound email: The FROM EMAIL will show the default email address for WebBeds' Freshdesk.

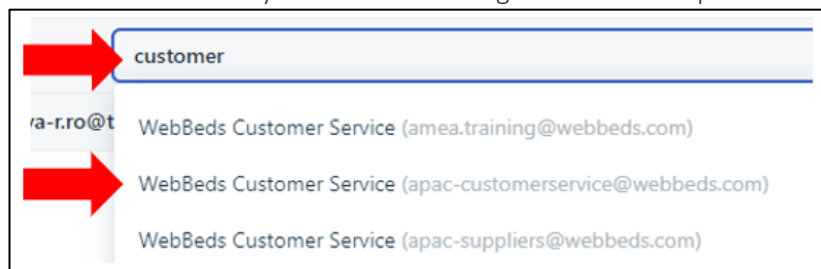

If a team member is sending out a reply or forwarding an email: The FROM EMAIL will show the default email address for the Freshdesk Group that the team member is handling.

If the email (whether new, reply or forward) needs to come from a different email address, it is possible to change the FROM email address. The team member would need to click on the FROM EMAIL box, which would allow the user to input the email address he/she would like to change the From Email to.

If the email address is already within Freshdesk, it will show in the pop-up results. The user will just need to choose the email address they would like to change to and it will update in the FROM EMAIL box accordingly.

TO EMAIL

To: shibuya-r.ro@tokyuhotels.co.jp

The TO EMAIL box shows the email address wherein the email will be sent to. Depending on what type of email communication the user is doing, the TO EMAIL box may or may not be changed or adjusted.

When **SENDING A NEW** email: The TO EMAIL box will be blank and the user needs to indicate the email address of the recipient that will receive the email. A maximum of one email address can be added in the TO field.

When **FORWARDING** an email: The TO EMAIL box will be blank and the user needs to indicate the email address of the recipient that will receive the email. A maximum of one email address can be added in the TO field.

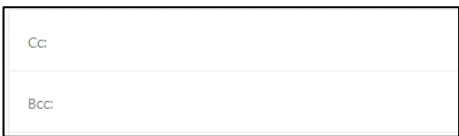

When **REPLYING** to an email: The TO EMAIL box is defaulted to our original contact (whether customer/supplier/WebBeds team member) 's email address and cannot be changed or adjusted.

CC and BCC

Cc Bcc

CC (Carbon Copy) and BCC (Blind Carbon Copy) allows you to add additional email addresses to the email recipients, however, they are not the main recipients of the email and are thus not required to take any action. By default, the CC and BCC boxes are collapsed when sending any kind of email (whether new, reply or forwarded).

Cc:

Bcc:

However, if a user needs to include any email address in the CC and BCC fields, the user will just need to click on either the CC or BCC links in the top right part of the email message box. This would expand either the box that was clicked, allowing the user to add an email address in CC or BCC.

WHEN TO ADD AN EMAIL IN TO, CC OR BCC

Depending on the action that you would like a recipient to do, once they receive the email, a user will need to properly choose where a recipient's email address needs to be placed: either in TO, CC or BCC.

Using the TO field: A recipient should be placed in the TO field if the contact is the main recipient of the email. These are the contacts who are required to read and act in response to the email sent.

Using the CC field: A recipient should be placed in the CC field if the user would like the contact to be aware of the situation/email but are not expected to take any action or reply to the message.

Using the BCC field: A recipient is placed in the BCC field if a user would like to send an email to multiple recipients, but do not want any of them to know about the other people you have sent them to. This is sometimes used by suppliers who would need to send an email to multiple clients but wants to keep the privacy of their client's email addresses.

EMAIL BODY & SIGNATURE

The email body is where a user will input the message that they would like to send out to the recipient, either as a new email, reply or forwarded email. By default, the email body is a blank page. The email body can also accept copy pasted images, so inserting images via the formatting options is not always necessary.

However, by adjusting the signature in the User Profile, a user can pre-save the greetings part of an email as well as the signature that would end every email a user sends out. This would avoid the need for the user to type in their signature manually, every time they need to send out an email.

ELLIPSIS (THREE DOTS ICON)

The lowest left part of the Email Body would show another set of Ellipsis (Three Dots Icon) to the user. If a user clicks on this ellipsis, it will expand the current email trail in the email message box.

By default, the current email trail (prior to the reply/forwarding) is collapsed in the email message box. However, if a user would need to see the prior email trail in the email message box, the user will just need to click on the Ellipsis in the email message box.

This expands the current email trail in the email message box, which would allow the user to remove any prior communication or email from the reply or forwarded email. Do take note that doing this will only remove the prior communication on that specific email (whether reply or forward). However, the email communication itself will still be stored in the ticket and will not be deleted.

FORMATTING OPTIONS

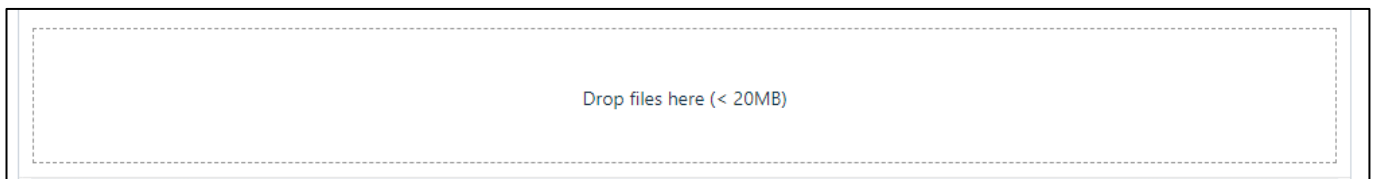

The lower part of the email message box gives a user to the different formatting options available for their emails, including placing words in either bold, italicized or underlines. It is also possible for a user to format parts of their emails in bulleted or numbered format, via the formatting options.

A user can also add a link to the email, insert an image or a table into the email, via the formatting options, as well.

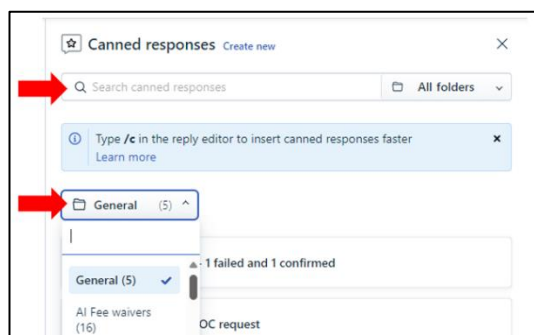

ATTACHMENT

Clicking on the Attachment Icon allows a user to attach any file as an attachment to the email, provided the file is less than 20 MB in size. It is also possible for a user to drag a file to the lower part of the email message box.

Doing this will open a box (see below example) that would allow a file to be directly attached to the email message box just by dragging the file into the email message box – without the need of manually clicking on the Attachment icon.

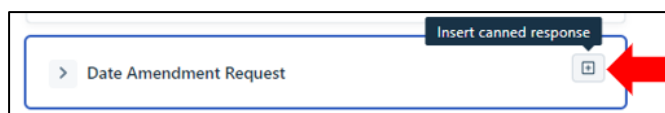

CANNED RESPONSES

Canned Responses are templates created by your leaders that a team member can use to create their emails more efficiently.

Clicking on the Canned Responses icon will open a pop-up box at the right side of the ticket, which would allow the user to search for the Canned Responses he/she would like to use.

The user has the option to search for the needed Canned Response, via the search box or via the drop-down menu.

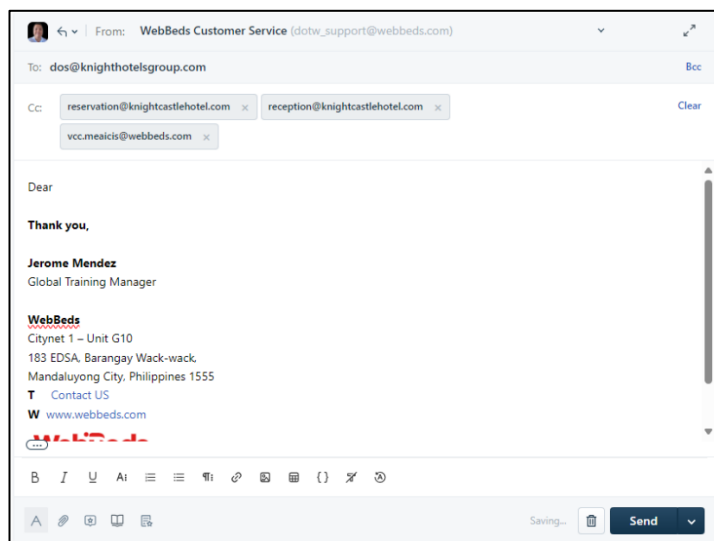

Once the user has found the needed Canned Response to use, he/she can hover the mouse to the right side until they cross icon appears.

The user will need to click on the cross icon, and this will encode the Canned Response into the email message box. The updated email body can still be adjusted by the team member.

REPLYING TO AN EMAIL

Replying to an email allows a user to reply to the latest inbound email in the Freshdesk ticket being handled. The reply button found in the Ticket Actions button acts like a “Reply to All” function, which allows a user to reply to all the recipients in the TO and CC fields.

When replying to an email, the user does not have the ability to:

- Change the or add an email address in the TO field, or
- Change the subject line.

Once the email body has been filled out with the email message, the user can click on the “SEND” button to send out the reply to the recipient.

Freshdesk does not have a recall feature. Thus, once an email has been sent out, it is not possible for it to be recalled back.

FORWARDING AN EMAIL

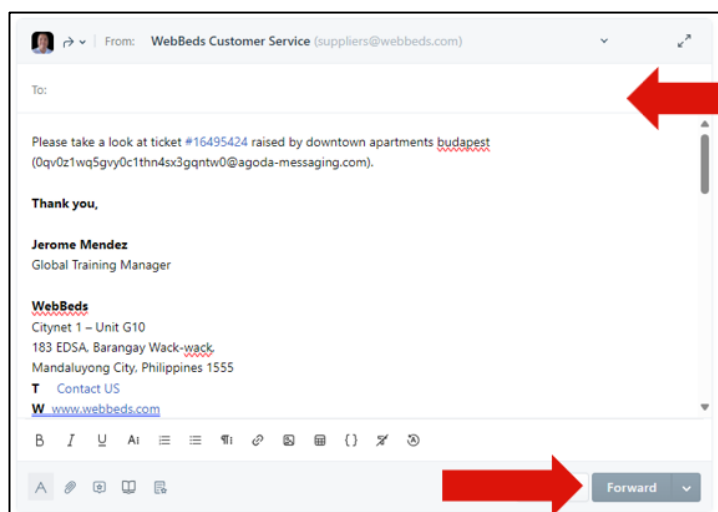

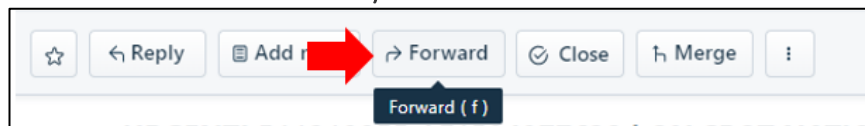

Forwarding an email allows a user to send a copy of the email trail to another set of email addresses than the original set of recipients. Unlike a reply that limits replaying to the latest email trail, forwarding allows a user to forward any email trail in the ticket.

There are two places in a ticket that the Forward button can be found, depending on which email needs to be forwarded.

The top right part of any specific email has a Forward button, allowing the user to **forward this specific email**. If a team member wants to forward a specific email, this is the best way to do it.

The ticket actions section of a ticket also has a Forward button. However, if a user uses this forward function, this will allow a user to **forward only the initial email in the ticket**.

When forwarding an email, the user can:

- Change the or add an email address in the TO field, or

However, the subject line for the email is not possible to be adjusted/modified.

Once the email body has been filled out with the email message, the user can click on the “FORWARD” button to send out the reply to the recipient.

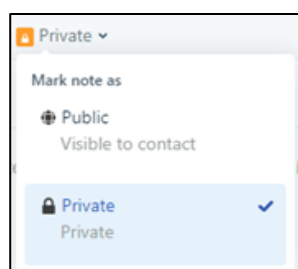

Freshdesk does not have a recall feature. Thus, once an email has been sent out, it is not possible for it to be recalled back.

ADD NOTE

The ADD NOTE functionality of Freshdesk allows a user to document a note in the ticket, whether as public or private note. There are different reasons why a user would document a note in the ticket, including:

- Documenting the actions done regarding the ticket, outside Freshdesk (ex: phone calls, actions in the platform)
- Reminders to the user/other users of what needs to be done to action the ticket
- Co-relate a related ticket to the existing ticket
- Ask assistance to another user regarding handling the ticket.

To add a note in Freshdesk, the user will need to click on the ADD NOTE action button in the top part of the ticket, to open the ADD NOTE box. The top part of the ADD NOTE box allows the user to choose whether a Public or Private Note will be created.

PUBLIC NOTE: If a user chooses this option, any notes input in the ticket will be added on a user’s replies/forwarded emails and will be seen/read by the recipient.

PRIVATE NOTE: If a user chooses this option, any notes input in the ticket will be kept internal to WebBeds and will not be seen by our contacts/recipients.

Notify to:

Called the hotel, advised they tried to change but declined. No charge made yet on the card

Booking Amount	Loaded Amount	Settlement Amount
170.75 USD	1.00 USD	0.00

Rich text editor toolbar: B, I, U, A, list, link, image, table, code, undo, redo.

Buttons: Cancel, Add note

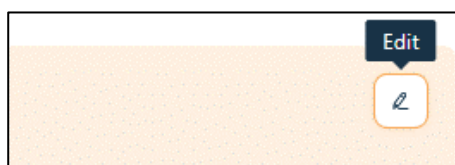

Once a user has chosen the type of note that will be created, the user will have access to the full message box functionality to add his/her notes.

This allows a user to include images and links to their notes, making it easier for the user to make the appropriate documentation.

Once the necessary information has been documented, the user can click on the ADD NOTE button to save the note into the ticket.

Once a note has been added, it can no longer be deleted by user. However, the user can edit or amend the existing note. Only the user who created the note can modify the documented note in Freshdesk.

EDITING AN EXISTING NOTE

If a user needs to edit an existing note, the user will need to go through the Freshdesk trail and look for the specific note that they would like to edit. Once the note is found, the user needs to hover to the top right part of the saved note – where the Edit button will appear.

This will open the Note's message box on the top part of the ticket, allowing the user to edit the existing note with the necessary modifications. Once the update in the note is completed, the user needs to click on the UPDATE button to save the modifications.

CORRELATING A RELATED TICKET VIA ADD NOTE

Notify to:

#16495424 Reply from downtown apartments budapest (Mar 17-20, 2024) - WebBeds (freshdesk.com)
Hotel's advice regarding the stop set

Rich text editor toolbar: B, I, U, A, list, link, image, table, code, undo, redo.

Buttons: Cancel, Add note

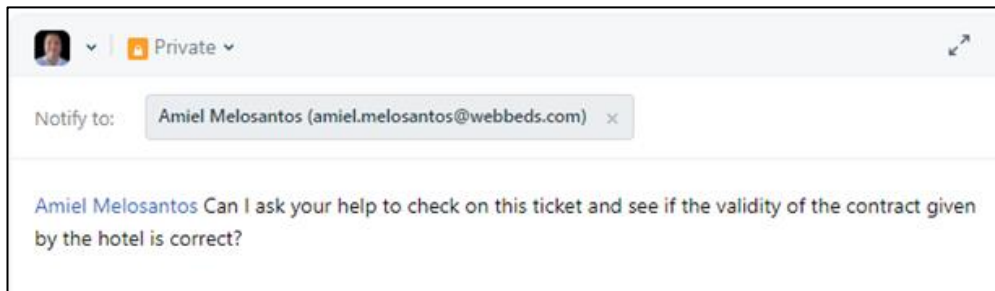

A user occasionally would need to correlate another ticket to the existing ticket being worked on, to allow the ticket to be easily accessed. This usually happens when the tickets are related (ex: other ticket is the customer/supplier ticket) to each other.

To do this, a user can copy the URL of the related Freshdesk ticket then paste this URL into the Note of the existing ticket. The user can also add a short documentation of what the link is about.

Once the information is documented, the user can click on the Add Note button to save the documentation into the ticket.

Whenever the user will need to access the related ticket, the user can just right click the URL in the note and open the related ticket in a new tab.

ASKING ASSISTANCE FROM ANOTHER USER VIA ADD NOTE

A Freshdesk can assistance or endorse the ticket to another user via Add Notes. This would be helpful in case a user needs help from his/her colleague or supervisor or needs to endorse assistance to a colleague working a later shift.

To do this via Add Note, the user needs to tag the other user @(their name) in the Add Note box. Once done, the other user's full name will show in the Notify To box. Afterwards, the user can proceed to add the documentation needed in the note box, as normal. Once done, the user needs to click on the Add Note button to save the note.

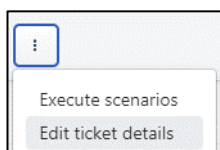

Once the note is saved, a notification to the other user in FD will appear in the other user's Freshdesk notifications. Subsequently, an email to the user will be sent, notifying them that a note tagging them was created in Freshdesk. The email will have a link to the ticket, which the other user can use to access the ticket from Outlook. In addition, the other user can reply directly via Outlook to the notification, and it will add a private note with the reply in Freshdesk.

EDIT TICKET DETAILS

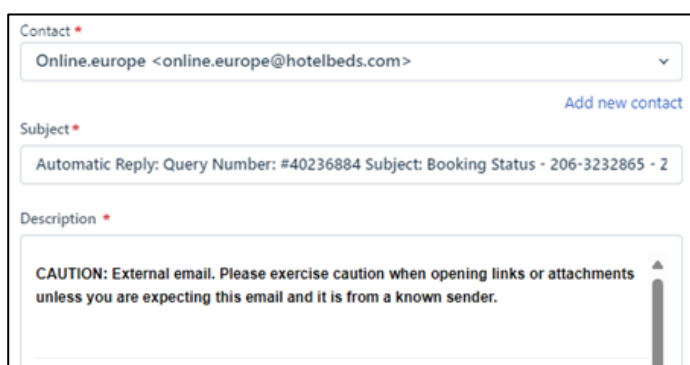

There are some situations wherein a ticket's subject is missing the necessary information, or the email address of the original recipient needs to be updated. On these cases, a user would need to edit the ticket details to allow these to be updated. To do this, the user needs to use the Edit Ticket Details functionality.

In the ticket actions section of the ticket, beside the Merge action button, the user will see an ellipse (three dots icon). The user will need to click on this to access the rest of the collapsed action buttons.

A drop-down box will appear below the ellipse with additional options. The user will need to choose the EDIT TICKET DETAILS option.

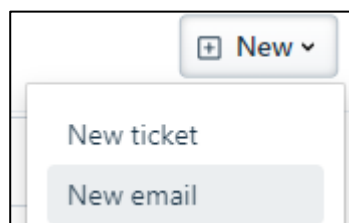

A pop-up box will appear in the right side of the ticket page, which will allow the user to adjust the ticket details, including:

- The main contact's email address.
- The ticket's subject line.
- The original email body.

Once the user is finished with the modifications, the user will need to click on the SAVE button in the lower part of the pop-up box. This will save the modifications in the ticket details, which will immediately be adjusted in the ticket and it's future correspondences.

CREATING A NEW EMAIL OR TICKET

The NEW button, located in the top right part of Freshdesk page, allows a user to either create a New Email or a New Ticket for their correspondence. The usage of each functionality depends on how the correspondence was started.

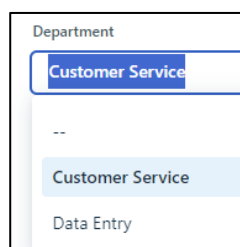

If the correspondence came from a phone call and there is no existing ticket created: user will need to use NEW TICKET to create a new ticket trail.

If the correspondence came from an existing ticket and the user needs to create a new ticket trail (for the customer or supplier): user will need to use NEW EMAIL to create a new ticket trail.

NEW TICKET

A team member will use the NEW TICKET functionality whenever they received a phone call or a chat, and they would need to document the conversation/discussion received. This functionality allows for a Freshdesk ticket to be created, even if there is no email documentation received from the recipient.

Once the NEW TICKET function is chosen, the page will update to load the New Ticket functionality. The first thing that a user will need to adjust would be the Department that they are part of.

The user will need to specify if they are part of the Customer Service department or the Data Entry department.

Contact *

"Hotel-reservations.training" <hotel-reservations.training@webbeds.com>

Add new contact | Add Cc

The user will, next, need to input the email address of the contact that they had spoken with. This would allow any future emails sent via this ticket to be sent to the contact's email address. The user has the option to add additional email addresses in the CC field.

Subject *

Reconfirmation Follow Up HTL-WB-123456789

The user will, next, need to input the subject line of the ticket. The reason for the contact and any related reference numbers is best to be documented in the subject box.

Group *

TRAC APAC JM

Agent

Jerome Rodriguez Mendez

The user will, next, need to input the owner of this ticket. Thus, the user will need to scroll down until he/she sees the Group and Agent boxes.

The user will need to choose the Group that the ticket will be under. The Agent name will automatically be placed under the name of the user who created the ticket. This can be adjusted, however.

Description *

Caller called to reconfirm the booking. I have tried to call the [hotel](#) but hotel is still closed. I will call back the hotel at a later time.

The user will, next, need to input the details of the phone conversation made in the Description box. The description box uses the same message box used in Freshdesk email and notes.

A user could input written documentation, images, links etc into the description box, which once saved, will work as the initial action to the ticket.

Booking Number

Try validation?

Booking Item ID

Once the necessary information has been documented, the user can click on the CREATE button in the lowest part of the page.

Doing this will create the ticket for the phone/chat conversation received. This would load the ticket in Freshdesk and allow the user to complete the rest of the ticket properties and ticket status required.

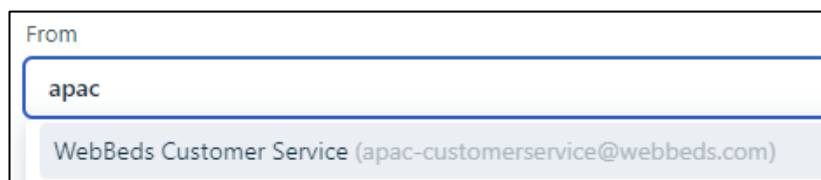

NEW EMAIL

A team member will use the NEW EMAIL functionality whenever there is a need to create an outbound email trail for another contact, separate from the original email trail. This is done as, to avoid miscommunication and accidental sharing of confidential information, we do not combine correspondences with two different contacts (ex: Customer and Supplier correspondences).

Thus, for example, we have the customer's ticket as the original ticket and we need to communicate to the supplier via email, a new ticket needs to be created via the NEW EMAIL functionality. Sending a new email will create a separate ticket for the other contact, which can be correlated via the Add Note functionality.

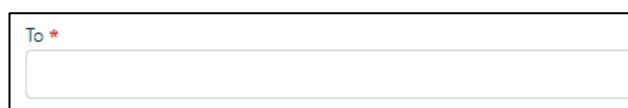

From
WebBeds Customer Service (dotw_support@webbeds.com)

When writing a new email, the From field show the default email address for WebBeds' Freshdesk.

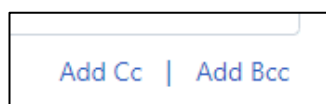

If the new email needs to come from a different email address, it is possible to change the FROM email address. The team member would need to click on the FROM box, which would allow the user to input the email address he/she would like to change the From Email to.

If the email address is already within Freshdesk, it will show in the pop-up results. The user will just need to choose the email address they would like to change to, and it will update in the FROM EMAIL box accordingly.

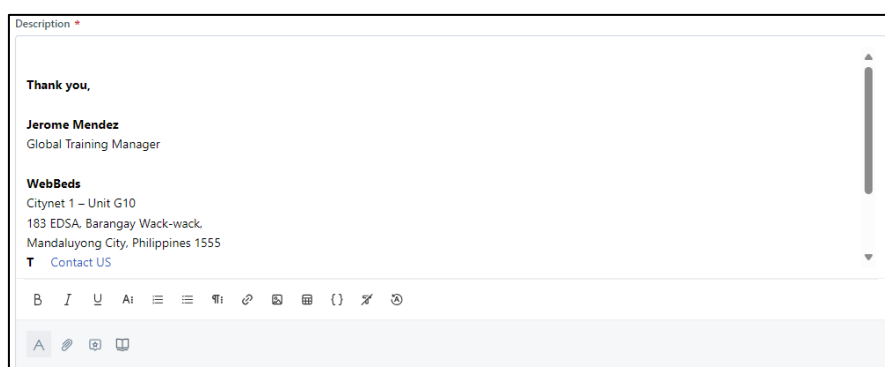

The user will next need to input the email address of the contact that they would need to reach out to in the TO box. A maximum of 1 email address can be added into the To box.

If there is a need to add additional recipients to the new email as an FYI, clicking on the Add CC or Add BCC links will open the CC or BCC box, allowing the additional email addresses of the recipients to be added.

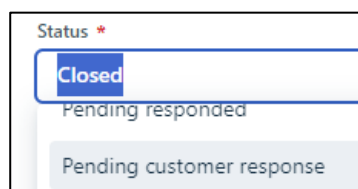

The user will, next, need to input the subject line of the ticket. The reason for the contact and any related reference numbers is best to be documented in the subject box.

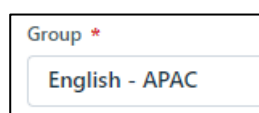

The user will, next, need to document the body of the email in the Description box.

The description box uses the same message box used in Freshdesk email and notes, allowing the user to add written documentation, images, links etc into the description box.

The user will, next, need to adjust the status of the email. By default, the status of the email is Closed. This, however, should be adjusted to the correct status of the ticket, as it applies, once the email is sent (ex: Open, Pending Customer Response, Pending Hotel Response, Resolved etc).

The user will, next, need to choose the Freshdesk group that the ticket will be under. There will be no need to choose a user as, once the email is sent, the ticket will be automatically assigned to the sender of the email as the owner.

Show more fields

The user will, next to scroll down and click on the Show more fields option. This will open additional ticket properties. However, the last thing that needs to be adjusted, prior to sending a new email, would be the Department box.

The user will need to choose which department he/she is under, whether it is Customer Service or Data Entry.

Once the user is ready to send the email out, the user can click on the Send button. If the user does not want to proceed to sending the email, he/she has the option to choose Cancel, which is going to discard the email.

Sending the email would create a separate ticket, with its own ticket number. This would, also, load the ticket in Freshdesk and allow the user to complete the rest of the ticket properties and ticket status required.

TICKET STATUSES

Whenever a ticket has been sent or actioned, the appropriate ticket status needs to be chosen by the team member. The correct, appropriate ticket status would help the team member know if the ticket has already been actioned or not. It also helps the team member determine the follow up action that needs to be done on the ticket, if any.

Choosing the correct ticket status also ensures that the SLA (Service Level Agreement) for the ticket response or resolution is properly monitored and managed, by the users and the leaders.

MANUALLY CHOSEN TICKET STATUSES

These ticket statuses are chosen by the user manually, based on the current action done in a ticket.

OPEN: This FD status is used for any tickets that are new and are unactioned.

PENDING CUSTOMER RESPONDED: This FD status is used for any tickets wherein there is pending action or response needed from the customer/client.

Status *

Pending hotel response
▼

PENDING HOTEL RESPONSE: This FD status is used for any tickets wherein there is pending action or response from a hotel (whether for a DC, Dynamic or CM booking).

Status *

Pending third party res
▼

PENDING THIRD PARTY RESPONSE: This FD status is used for any tickets wherein there is pending action or response from a supplier (whether DMC or 3P supplier).

Status *

Pending internal dept. r
▼

PENDING INTERNAL DEPT. RESPONSE: This FD status is used for any tickets that have already been actioned, but the team is awaiting response or action from another WebBeds team member or department.

Status *

Resolved
▼

RESOLVED: This FD status is used for any tickets wherein all the necessary actions have been completed and no other further action is needed.

SYSTEM AUTOMATED TICKET STATUSES

These ticket statuses are automatically chosen by the statuses, dependent on certain specifications or actions related to an existing ticket. These statuses should not be chosen manually by a user.

Status *

Pending responded
▼

PENDING RESPONDED: This FD status is chosen by the system whenever a reply or response is received for a ticket that was on Pending status (whether Pending Customer, Pending Hotel, Pending Third Party or Pending Internal Department response.)

Status *

Reopened
▼

REOPENED: This FD Status is chosen by the system whenever a reply or response is received for a ticket that was on Resolved status, provided it is within 7 days from when the ticket was placed on Resolved status.

Status *

Closed
▼

CLOSED: This FD Status is chosen by the system whenever a ticket was on Resolved status and no reply or response was received within 7 days from the date it was resolved.

If a contact replies or responds to a ticket that is already in Closed status, the ticket will no longer re-open. Instead, a new ticket will be created and will be added to the FD group where the original ticket was part of.

REQUIRED TICKET PROPERTIES FOR CS TEAM FOR ALL TICKET TYPES

Once a ticket is handled or created by a team member, the required ticket properties need to be filled out by the team member. Some of these ticket properties can be automated, while some need to be chosen manually.

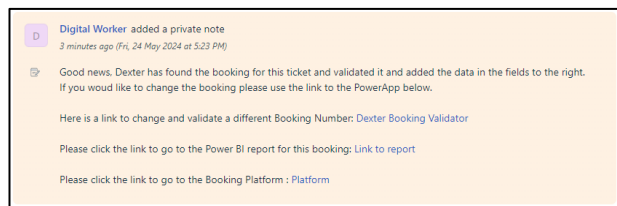

Booking Number *

123456789

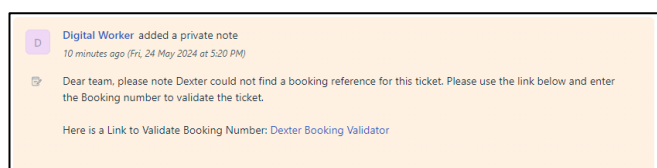

BOOKING NUMBER: This field is where the booking reference number of the WebBeds booking related to the ticket needs to be documented. When inputting the booking number, it should only include the actual booking number, with no letters included.

In the event no booking number applies to the ticket, NA can be input in the Booking Number box.

The booking number filed occasionally can be filled in automatically by the system, if the automated system, Dexter, is able to find the booking in the system. If Dexter can find the booking, the Booking number will automatically be filled out and the following private note will appear in Freshdesk:

If Dexter is not able to find the booking, the Booking number will be kept blank. In addition, the following private note will appear in Freshdesk:

WHAT TO DO IF DEXTER IS NOT ABLE TO FIND THE BOOKING?

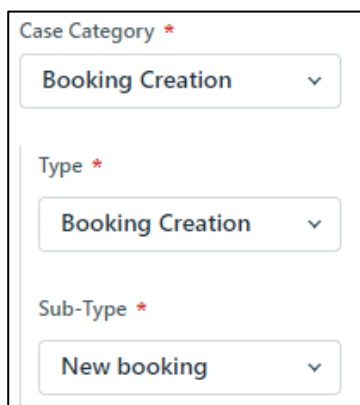

If Dexter, the automated system, is not able to find the booking and fill out the Booking Number, it is the CS team member's responsibility to fill it out and help Dexter to automate the ticket properties. To do this, the user will need to:

Input the Booking # in the Booking Number box. → When inputting the booking number, only the numbers should be added. Any letters in the Ref # should not be included.

For DOTW Bookings: either the DOTW Ref # or the DOTW Itinerary # can be input in the Booking Number box.

Change the Try Validation? Option to Yes → Once the booking number box is filled out, the user will need to change the option in Try Validation? Field to Yes. Doing this will manually trigger Dexter to find the booking and fill out the other ticket properties that are automated.

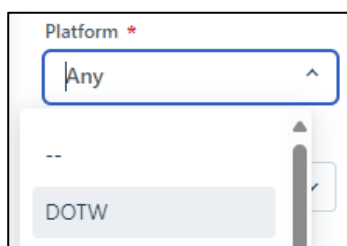

CORRESPONDENCE WITH: This field is where the user will need to input and choose which contact is the user corresponding with in this ticket, whether it would be the Customer/Client, Supplier (includes hotels) or Internal (for Internal WebBeds team members/departments).

CASE CATEGORY, TYPE and SUB-TYPE FIELDS: These fields are where the user input what the ticket is about. The user will first need to define what case category the ticket is about.

Once done, the Type field will open, allowing the user to choose the appropriate ticket type.

Lastly, the Sub-type field will open, allowing the user to choose the appropriate ticket sub-type for the ticket.

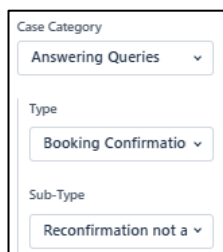

PLATFORM: This field allows the user to specify which WebBeds platform is the ticket about, whether the ticket is for a DOTW platform booking or a MAKER (SunHotels) platform booking.

SCENARIO BASED REQUIRED TICKET PROPERTIES

RECONFIRMATION OF CONFIRMED STATUS BOOKINGS – PENDING HCN

When handling a reconfirmation ticket but the hotel confirmation number has not yet been received, there are some specific ticket properties that would need to be chosen by a CS team member:

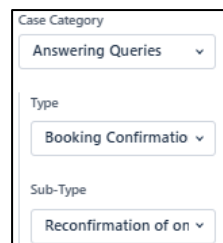

CASE CATEGORY: choose Answering Queries

TYPE: choose Booking Confirmation

SUB-TYPE: choose Reconfirmation not available

On these situations, the HCN is not required to be filled out in the ticket properties.

RECONFIRMATION OF ON-REQUEST STATUS BOOKINGS

CASE CATEGORY: choose Answering Queries

TYPE: choose Booking Confirmation

SUB-TYPE: choose Reconfirmation of On-Request

On these situations, the HCN is not required to be filled out in the ticket properties.

RECONFIRMATION OF CONFIRMED BOOKINGS – WITH HCN

If a user is handling a reconfirmation ticket and the HCN is already received, other than updating in the WebBeds platform, this needs to be updated as well in the relevant tickets. Thus, the team member needs to choose the following required ticket properties, otherwise, the user will not be able to resolve the ticket.

Case Category

Answering Queries
